Australia’s bad drug deal: High pharmaceutical prices

Stephen Duckett

March 2013
Agenda

• Pharmaceutical Benefits Scheme (PBS) costs and prices
• Grattan analyses
• How pharmaceutical pricing works now
• A better way to purchase
• Responding to potential concerns
Australia’s total spending on the Pharmaceutical Benefits Scheme is increasing in real terms
Although our prices were cheaper than UK and Europe five years ago, they’re not now

Australia’s pharmaceutical price ranking against selected countries, 2007-2011

Prices relative to Australia (Australia = 100%)

Source: Grattan Institute analysis of OHE data
The market has two distinct submarkets

- Patented drugs
  - Sole supplier arrangements
  - No patient choice
  - The (relevant) policy issues are whether the incremental benefits of listing this drug is worth it and what should the subsidised price be?

- Off-patent drugs
  - Potential for multiple suppliers
  - Low marginal cost of production
  - The (relevant) policy issue is what should the subsidised price be?
Grattan analyses

- Identified the 50 drug-dose combinations that are highest volume on PBS and the 50 that are highest expenditure on PBS
- Combined into list of 75

- Compared prices of these drugs-doses with prices paid by PHARMAC, the New Zealand purchaser
  - 62 identical
  - 11 substitutes
  - 2 not matched

- Compared prices paid by public hospitals in two states
  - One unnamed state: 59 identical drugs
  - Western Australia: 39 identical drugs
PBS prices are far higher than the comparators we studied – often by more than an order of magnitude

Note: chart represents the 58 identical doses for which the benchmark model was cheaper than the PBS. Only 39 drugs where the PBS cost is more than twice that of the comparator are displayed (average is for all 58 doses).

Our performance is worst when it matters most

Ex-manufacturer prices for identical drugs as multiples of NZ prices, by total cost (left) and volume (right), 2011-12

Source: Grattan Institute analysis
The Atorvastatin story

• $700 million expenditure in 2011-12 (Pfizer brand name: Lipitor); $570m by government

 Australian price
30 X 40mg tablets
$51.59*

 New Zealand price
90 X 40mg tablets
AU$5.80

• If Australia paid the NZ price with current pharmacy mark-ups, the price would plummet to $14.10, a savings to consumers of $22 per prescription.

• On current prescription volumes, and across the most commonly prescribed forms of Atorvastatin, these higher prices (compared to NZ) amount to excess costs to government of over $1.4 million every day

• If patients in Perth could buy Atorvastatin at the same price as their local public hospital, they’d save $19 per prescription

* At our reference date, October 2012
Lower prices would mean big savings for patients

Patient savings per pack (non-concessional patients), based on benchmark prices, selected doses, 2011-12

Source: Grattan Institute
The problems of the process

• ‘Expanded and accelerated price disclosure’
• Embedded politics
• Framework agreement (MOU)
• Timid price cuts on new generics
The current price disclosure process

1. Brand becomes subject to Expanded and Accelerated Price Disclosure
2. Drug company collects price disclosure data
3. Drug company submits price disclosure data for the reporting period
4. Service provider (working for the Department) calculates average disclosed price
5. Service provider notifies the Department of price outcome
6. Department makes a determination
7. Scheduled reduction

Minimum 12 months

Minimum 6 months
Current efforts to reduce prices don’t go far enough

Current prices for drugs targeted for price disclosure

Source: Grattan Institute analysis. Note: “Amoxycillin +” is amoxycillin with clavulanic acid.
Current efforts to reduce prices don’t go far enough

Price disclosure brings some drug prices down....

Source: Grattan Institute analysis. Note: “Amoxycillin +” is amoxycillin with clavulanic acid.
Current efforts to reduce prices don’t go far enough

But benchmarking would save a lot more money

Source: Grattan Institute analysis. Note: “Amoxycillin +” is amoxycillin with clavulanic acid.
The current flawed process - 1

The pricing authority is an internal committee of Department of Health and Ageing comprised of ‘representatives’ (Medicines Australia, generics manufacturers, consumers)

The Minister (and possibly Cabinet) have a say at the end of the whole process
The whole framework is governed by a political accommodation: a memorandum of understanding between Medicines Australia and government:

*The Commonwealth undertakes not to implement new policy to generate price-related savings from the PBS during the period of agreement [May 2010 to July 2014], that is, measures that would change the ex-manufacturer prices of particular medicines, other than that reflected by this MOU*

- Current Memorandum of Understanding between the Commonwealth and Medicines Australia
Other countries require tough price drops with new generics

Mandated generic price reductions, selected countries

Austria and Korea impose additional cuts for the second and subsequent generics that enter the market.

Most Canadian states have imposed cuts of 82% on the price of six generics.
Reform stage 1: get the foundations right

- Independent governance
- Indexed (rather than uncapped) budget to live within
- Reverse the politics
- All this can happen in 2013-14
Next stages of reform

Stage 2

• At least a 50% cut for new generics
• Benchmark pricing on regular basis thereafter
• These changes generate savings of at least $1.3 billion each year

Stage 3

• Widen application of therapeutic premiums for substitute drugs
• This is likely to generate a further $550 million of saving each year (indicative estimate only)
Benchmarking against three jurisdictions yields up to $1.86 billion in savings

Generic pharmaceuticals make up the majority of savings

Most savings come from New Zealand's cheaper prices

Percentage of drugs from each jurisdiction
Possible phase in

- Foreshadow new arrangements and establish Pricing Board (funded in 2013-14 Budget)
- Agreement with Medicines Australia expires June 2014
- Pricing Board negotiates prices for new drugs
- Annual drug expenditure set in Commonwealth Budget
- Cut generics to 50% of originator prices
- Generic price benchmarking
- Renegotiate pre-existing prices on patented drugs
- Broaden therapeutic group premium pricing
Criticisms – can we compare ourselves against other jurisdictions?

• “The idea you can just pick and choose elements of other countries’ systems and that automatically gives us a better, stronger system…is incorrect”

  - Minister Plibersek, 18 March

- Considerable debate in the literature about difficulty of cross-national policy learning
- We were selective in what of New Zealand (and Western Australia and other state) we picked up on
Criticisms – public hospitals are loss leaders?

• In Australian public hospitals, “companies are happy to take a very low price…so that when [patients] go into the community, they stay on that particular brand of medicine”

  - Minister Plibersek, 18 March

- Little evidence that companies making a loss selling to public hospitals
- This does not explain the even lower prices in New Zealand. The hospital prices are close to those.
Criticisms – sole supplier/tendering process would create problems with access

“New Zealand is a basket case when it comes to access to medicines…it’s the last place health policymakers in this country should be looking to for ideas”

– Dr Brendan Shaw, CEO Medicines Australia

- Only relevant to patented drugs, not relevant to our proposed generic drug pricing reforms (vast bulk of savings)
- However NZ does have lower access and a lag time with getting new drugs on market, but prescription volumes for most commonly used drugs has increased while expenditure has been nearly flat

000 prescriptions per million population

$NZ millions (ex-GST and rebates) (2012)
Criticisms – the current system is working fine

“Australian suppliers of generic medicines already sell their medicines at international world best prices due to a very competitive generic medicines industry in Australia…[Grattan’s] concerns are unfounded as [price disclosure ensures that the government benefits…”

- Kate Lynch, CEO Generic Medicines Industry Association

Similar statements from the Health Minister, Brisbane Times and Pharma in Focus

Ex-manufacturer price ($)
Criticisms - Choice

“It’s true that New Zealand does get a good price for generic medicines, but they have a great deal less choice for patients”

- Minister Plibersek, Monday 19 March

- Choice by itself is not a pre-eminent value (e.g. no choice for patented medicines because of trade-off of value of choice and value of innovation and patent protection)
- Choice is supposed to be part of competitive ideal and lead to savings
- Our model does not propose elimination of choice (benchmarking model, not tendering)
- How much should choice count against cost savings to patients?
Would patients prefer a choice of 13 brands, or $22 saving?

- Torvastat 40
- Trovas
Other concerns – lower income for retail pharmacies

- Retail pharmacy income will decline from price disclosure
  - Unanticipated additional income for pharmacies from manufacturer discounts (i.e. agreed and subsidised ex-manufacturer not market price)
  - Difficult to quantify discounts (largely secret), likely substantial.

- Pharmacy income partly based on per cent mark-ups so impacted by price
  - Report impact $20,000 per pharmacy
  - May require restructure of subsidy arrangements (e.g. Rural Support Scheme)
Other concerns – loss of research and development in Australia

Lower prices = lower profits in Australia will hinder in-country R&D

• Little evidence in-country prices drive R&D location

• Australian research is vulnerable to competition from countries that can conduct clinical trials more cheaply

• Direct strategies to support R&D preferred to indirect ones
Ending Australia’s bad drug deal

1. Start by getting the foundations right: independent governance and an incentive to save
2. Tougher rules on generic pricing
3. Promoting costs-effective choices

Savings

Stage 1 and 2: $1.3 billion each year (2014-15 onward)
Stage 3: around $550 million each year (2016-17 onward)
